

# Measurement of the Hadronic Cross Section at KLOE/KLOE2

Veronica De Leo on behalf of the KLOE/KLOE-2 Collaborations

The precise measurement of the  $e^+e^- \rightarrow \pi^+\pi^-(\gamma)$  cross section is particularly important to test the Standard Model (SM) calculation for the muon anomaly  $a_\mu$ .

Different measurements of the  $\pi^+\pi^-$  cross section using the Initial State Radiation have been performed with the KLOE detector at the DAΦNE facility in Frascati.

The preliminary results on the combination of the last analysis (KLOE12) with the previous published ones (KLOE08, KLOE10) will be presented.

The results confirm the current discrepancy ( $\sim 3\sigma$ ) between the SM calculation and the experimental value of the muon anomaly.
